

Regula falsi method

❖ Explain Regula Falsi Method for finding root of the equation.

➤ Let $f(x)=0$ be a non linear eqn.

If initial approximation is given $[x_0, x_1]$

If initial approximation is not given be tabulated $f(x)$ and find two value of

$$x=x_0 \text{ \& } x=x_1,$$

Such that,

$$f(x_0) \cdot f(x_1) < 0$$

$[x_0, x_1]$ use as initial approximation

This method depends on the principle of very small distance the graph of smooth curve

In $\triangle PNB \sim \triangle PCD$
